AttributeError: 'super' object has no attribute - Stack Overflow Jul 9, 2018 · I wrote the following code. When I try to run it as at the end of the file I get this stacktrace: `AttributeError: 'super' object has no attribute do_something` class Parent: def __init__(self):... *super () in Java - Stack Overflow* Sep 22, 2010 · `super()` is a special use of the `super` keyword where you call a parameterless parent constructor. In general, the `super` keyword can be used to call overridden methods, access hidden fields or invoke a superclass's constructor. *'super' object has no attribute '__sklearn_tags__'* Dec 18, 2024 · `'super' object has no attribute '__sklearn_tags__'`. This occurs when I invoke the `fit` method on the `RandomizedSearchCV` object. I suspect it could be related to compatibility issues between Scikit-learn and XGBoost or Python version. I am using Python 3.12, and both Scikit-learn and XGBoost are installed with their latest versions. *How does Python's super () work with multiple inheritance?* In fact, multiple inheritance is the only case where `super()` is of any use. I would not recommend using it with classes using linear inheritance, where it's just useless overhead. *What is a difference between <? super E> and <? extends E>?* Sep 2, 2009 · The first (<? super E>) says that it's "some type which is an ancestor (superclass) of E"; the second (<? extends E>) says that it's "some type which is a subclass of E". (In both cases E itself is okay.) So the constructor uses the ? extends E form so it guarantees that when it fetches values from the collection, they will all be E or some subclass (i.e. it's compatible). The `drainTo` method ... [python - replace block within { { super \(\) } } - Stack Overflow](#) In the child template, I would like to include everything that was in the head block from the base (by calling { { super() } }) and include some additional things, yet at the same time replace the title block within the super call. *Python: 'super' object has no attribute 'attribute_name'* After the base class's `__init__` ran, the derived object has the attributes set there (e.g. `some_var`) as it's the very same object as the `self` in the derived class's `__init__`. You can and should just use `self.some_var` everywhere. `super` is for accessing stuff from base classes, but instance variables are (as the name says) part of an instance, not part of that instance's class. *oop - What does 'super' do in Python? - Stack Overflow* Nov 3, 2015 · The one without `super` hard-codes its parent's method - thus it has restricted the behavior of its method, and subclasses cannot inject functionality in the call chain. The one with `super` has greater flexibility. The call chain for the methods can be ... **Understanding Python super() with __init__() methods** Feb 23, 2009 · `Super` simply guarantees we call the correct next class's method in the method resolution order, whereas the other way hard-codes the next method to be called, which makes cooperative multiple

inheritance more difficult. [coding style - Using "super" in C++ - Stack Overflow](#) As for chaining super::super, as I mentioned in the question, I have still to find an interesting use to that. For now, I only see it as a hack, but it was worth mentioning, if only for the differences with Java (where you can't chain "super").
