**Cone Beam Computed Tomography in Orthodontics** Sunil D. Kapila, 2014-08-29 Since its introduction to dentistry, cone beam computed tomography (CBCT) has undergone a rapid evolution and considerable integration into orthodontics. However, despite the increasing popularity of CBCT and progress in applying it to clinical orthodontics, the profession has lacked a cohesive, comprehensive and objective reference that provides clinicians with the background needed to utilize this technology optimally for treating their patients. Cone Beam Computed Tomography in Orthodontics provides timely, impartial, and state-of-the-art information on the indications and protocols for CBCT imaging in orthodontics, clinical insights gained from these images, and innovations driven by these insights. As such, it is the most current and authoritative textbook on CBCT in orthodontics. Cone Beam Computed Tomography in Orthodontics is organized to progress sequentially through specific topics so as to build the knowledgebase logically in this important and rapidly evolving field. Part I provides the foundational information on CBCT technology, including radiation exposure and risks, and future evolutions in computed tomography. Part II presents the Principles and Protocols for CBCT Imaging in Orthodontics, focusing on developing evidence-based criteria for CBCT imaging, the medico-legal implications of CBCT to the professional and the protocols and integration of this technology in orthodontic practice. Part III provides critical information on CBCT-based Diagnosis and Treatment Planning that includes how to interpret CBCT scans, identify incidental pathologies and the possible other uses of this technology. Part IV covers practical aspects of CBCT's Clinical Applications and Treatment Outcomes that encompasses

a range of topics, including root morphology and position, treatment of impacted teeth, virtual surgical treatment planning and outcomes, and more.

**Vascular and Neurosensory Evaluation of Mandibular Genial Spinal Canal Related to Midline Implant Installation in Completely Edentulous Patients** ,2017 Introduction: Single midline implant placement has become a worthwhile treatment option to solve the problems of retention and stability of mandibular dentures in completely edentulous patients, which improves significantly their quality of life (Kern et al. 2018). The inter-foraminal region has been considered as a safe area for implant installation. However, the presence and the content of the lingual foraminae and their associated canals in this area have been a point of debate for midline implant placement (Bernardi et al. 2017). The lingual canals (LCs) contain blood supply supplemented with some innervations, which may lead to postoperative complications following implant insertion. Such complications might be manifested as profuse bleeding, anesthesia, paresthesia, and dysesthesia (Fujita et al. 2012). Aim of the Study: To investigate whether there are any vascular and/or neurosensory changes following the installation

of implants in the midline of the mandible being in close proximity to the mandibular lingual canals. **Materials and Methods:** Fifty completely edentulous patients were recruited from the outpatient clinic of the Prosthodontics Department, Faculty of Dentistry, Cairo University. All patients in this study (50 to 69 years old) were seeking to install single implant at the midline of the mandible to improve the retention of their mandibular complete dentures (38 males and 12 females). The patients' 2019 complete dentures were duplicated to fabricate radiographic stents, with radio-opaque acrylic resin anterior incisors. A CBCT (ProMax 3D Mid, Planmeca, Helsinki, Finland) was then performed for all patients while wearing their radiographic stent. The Blue Sky Bio software (Blue Sky Plan, version 3.29.18, Grayslake IL, USA) was used for diagnostic and virtual implant planning at the midline of the mandible, following the direction of the radio-opaque acrylic resin teeth. The relation between the potential implant site and the LCs was assessed independently by two Oral and Maxillofacial Radiologists, who examined as well the anatomy and all dimensions of the lingual foramina/canals in the midline. The radiographic stent was then converted into a surgical stent to be used for implant installation. All inserted implants were 3.7 mm in diameter and 10 mm in length (Tapered screw vent, Zimmer Dental, Indiana, USA). During and after implant placement, all vascular changes were recorded, and 2 weeks later different physical neurosensory tests were carried out for all patients, including pin pressure, static touch detection, direction of movement, and two-point tests. All patients were then recalled after 3 months from implant installation for the prosthetic loading and the evaluation of the neurosensory changes were reassessed again. Any reported vascular and/or neurosensory changes were given a score of (1), otherwise a score (0) was given when these changes were absent. Statistical analysis was performed using Statistical Package for Social Sciences (IBM SPSS for Windows, Version 21.0, IBM SPSS, Inc., and Chicago, IL, USA). Data were explored for normality using Kolmogorov-Smirnov test and Shapiro-Wilk test. A two-way analysis of variance with repeated measures was used accordingly. Comparisons between both the vascular and neurosensory changes and the different variables were done using the independent t-test. Categorical data were summarized as percentages; differences were analyzed with  $\chi^2$  (chi square) tests and Fisher's exact test. Adjustments of p value were done using the Bonferroni method for multiple testing, so that P-values  $\leq 0.05$  were considered significant. **Results:** All 50 patients showed at least one canal. A supra-spinosum canal was found in 49 patients, where 8 patients showed two canals. An infra-spinosum canal was found in 38 patients, where 10 patients showed two canals. Only 6 patients (12%) had reported profuse bleeding throughout the osteotomy during implant placement, which was stopped easily by applying gauze pressure for 5 minutes, and no further hemorrhagic complications were reported postoperatively, with a non-statistically significant correlation to all of the considered factors (patient's age related and LC's age related). Thirteen patients (26%) had encountered transient neurosensory changes, which disappeared after 3 months, with also non-statistically significant correlation to all considered factors (patient's age related and LC's age related). According to virtual implant planning, 44 patients (88%) had their implants, with possible invasion of the

LCs. Even though, only 6 patients of them have reported vascular changes (14%), and 12 of them have reported sensory changes (27%), which were transient changes. Only one patient experienced both vascular and sensory changes. For the 6 patients who had their implants not invading the canal, no vascular changes were reported, and only one patient had reported transient neurosensory changes, with also a non-statistically significant correlation to the factors considered. Being in close proximity to the LC (possible injury of the canal) showed no statistically significant correlation to the reported vascular and neurosensory changes. Conclusion: The mandibular lingual canals seem to be constant anatomical landmarks that are present in the midline of the mandible. Injuries of the supra-spinosum lingual canals during implant placement in the midline of the mandible without perforation of bone cortices did not result in any serious vascular or permanent neurosensory changes in this study.
