*The Vestibulo-ocular Reflex and Vertigo* James A. Sharpe, Hugh O. Barber, 1993 This volume reviews clinically relevant studies of the vestibulo-ocular reflex, the otolithic-ocular reflex, and related eye movements and highlights the practical applications of these findings in the management of patients with vertigo (dizziness and/or balance disturbance) and the design of exercise programmes for vestibular rehabilitation. The section on diagnosis and treatment of vertigo addresses concerns such as psychogenic dizziness, imbalance and falls in the aged, and perilymph fistula, and includes descriptions of outpatient and postoperative vestibular rehabilitation programmes and surgical treatment of benign postural vertigo. Nystagmus, a cardinal physical sign of vestibular disorder, is also discussed in detail. Other contributors describe new approaches to testing the vestibulo-ocular reflex and otolithic function.

Using Eye Movements as an Experimental Probe of Brain Function R. John Leigh, Christopher Kennard, 2008-09-02 This volume of Progress in Brain Research is based on the proceedings of a conference, Using Eye Movements as an Experimental Probe of Brain Function, held at the Charing Cross Hospital Campus of Imperial College London, UK on 5th -6th December, 2007 to honor Professor Jean Büttner-Ennever. With 87 contributions from international experts – both basic scientists and clinicians – the volume provides many examples of how eye movements can be used to address a broad range of research questions. Section 1 focuses on extraocular muscle, highlighting new concepts of proprioceptive control that involve even the cerebral cortex. Section 2 comprises structural, physiological, pharmacological, and computational aspects of brainstem mechanisms, and illustrates implications for disorders as diverse as opsoclonus, and congenital scoliosis with gaze palsy. Section 3 addresses how the cerebellum transforms neural signals into motor commands, and how disease of such mechanisms may lead to ataxia and disorders such as oculopalatal tremor. Section 4 deals with sensory-motor processing of visual, vestibular, somatosensory, and auditory inputs, such as are required for navigation, and gait. Section 5 illustrates how eye movements, used in conjunction with single-unit electrophysiology, functional imaging, transcranial magnetic stimulation, and lesion studies have illuminated cognitive processes, including memory, prediction, and even free will. Section 6 includes 18 papers dealing with disorders ranging from congenital to acquired forms of nystagmus, genetic and

degenerative neurological disorders, and treatments for nystagmus and motion sickness.\* Clinicians will find important new information on the substrate for spinocerebellar ataxia, late-onset Tay-Sachs disease, Huntington disease, and pulvinar lesions\* Organizes multiple articles on such topics as proprioception, short and longer-term memory, and hereditary cerebellar ataxias for a more coherent presentation\* Articles on anatomic tracers, functional imaging, and computational neuroscience are illustrated in color

**The Vestibular System** Stephen M. Highstein, Richard R. Fay, 2006-04-18 The Springer Handbook of Auditory Research presents a series of comprehensive and synthetic reviews of the fundamental topics in modern auditory research. The volumes are aimed at all individuals with interests in hearing research, including advanced graduate students, postdoctoral researchers, and clinical investigators. The volumes are intended to introduce new investigators to important aspects of hearing science and to help established investigators to better understand the fundamental theories and data in fields of hearing that they may not normally follow closely. Each volume is intended to present a particular topic comprehensively, and each chapter will serve as a synthetic overview and guide to the literature. As such, the chapters present neither exhaustive data reviews nor original research that has not yet appeared in peer-reviewed journals. The volumes focus on topics that have developed a solid data and conceptual foundation rather than on those for which a literature is only beginning to develop. New research areas will be covered on a timely basis in the series as they begin to mature.

*David A. Robinson's Modeling the Oculomotor Control System*, 2022-01-22 Modelling: The Oculomotor Systems, Volume 269 in the Progress in Brain Research series highlights new advances in the field with this new volume presenting interesting chapters on topics including The function and phylogeny of eye movements, The behavior of motoneurons, Statics of plant mechanics, Dynamics of plant mechanics, The functional operation of the vestibulo-ocular reflex, Basic framework of the vestibulo-ocular reflex, Oculomotor signals, Signal processing in the vestibulo-ocular reflex, Plasticity and repair of the vestibulo-ocular reflex, The behavior of the optokinetic system, Models of the optokinetic system, Neurophysiology of the optokinetic system, and much more. - Provides the authority and expertise of leading contributors from an international board of authors - Presents the latest release in Progress in Brain Research series - Includes the latest information on Modelling: The Oculomotor Systems

**Neuroanatomy of the Oculomotor System** Jean A. Büttner-Ennever, 2005-11-09 This volume in the Progress in Brain Research series features reviews on the functional neuroanatomy and connectivity of the brain areas involved in controlling eye movements. Oculomotor control of the eyes is now the subject of many research projects and advances in this field are relevant to understanding motor control in general.

**Vestibular Dysfunction and Its Therapy** U. Büttner, 1999-07 The book provides the first comprehensive, multidisciplinary approach to the topic for all involved in the diagnosis and therapy: physicians (neurologists,

otorhinolaryngologists, ophthalmologists), physical therapists and orthoptic assistants. A comprehensive review of basic mechanisms, as well as the clinical picture and its therapy are given. It also is valuable for scientists in basic research who want to relate oculomotor, vestibular and neuropharmacological results to their findings. Topics covered are: anatomy, neurophysiology and neurotransmitters relevant for the generation of eye movements in the vestibular nuclei and other brainstem areas including the cerebellum; peripheral vestibular disorders and their therapy; a complete overview on vestibular compensation, which forms the basis for therapy in vestibular neuritis; the now well understood mechanisms of benign paroxysmal positional vertigo (BPPV) and its effective therapy; pathophysiology and therapeutical principles in Menière's disease; latest information on treatment for involuntary eye movements of central origin.

**The Neurology of Eye Movements** R. John Leigh, David S. Zee, 2015 It is a tremendous achievement to have provided this highly comprehensive but readable text, which informs such a large group of researchers and clinicians. Christopher Kennard, PhD, FRCP, FMedSci, Professor of Clinical Neurology, Head, Nuffield Department of Clinical Neurosciences, University of Oxford, John Radcliffe Hospital, Oxford, United Kingdom. A monograph written with deep knowledge, understanding, wisdom, clarity, intelligibility - the superlatives could go on and on... A remarkable achievement and a great gift to all of us from the two modern giants of eye movement disorders. Michael Halmagyi, MD, Eye and Ear Research Unit, Neurology Department, Royal Prince Alfred Hospital, The University of Sydney, Australia. The fifth edition of *The Neurology of Eye Movements* is a must for all neurologists and neuroscientists interested in how the human vestibular and oculomotor systems adapt to movement in space and to optimally viewing the world and its contents. Louis R. Caplan, MD, Department of Neurology, Beth Israel Deaconess Medical Center, Harvard Medical School, Boston, Massachusetts.

**Lifespan Neurorehabilitation** Dennis Fell, Karen Y Lunnen, Reva Rauk, 2018-01-02 The neuro rehab text that mirrors how you learn and how you practice! Take an evidence-based approach to the neurorehabilitation of adult and pediatric patients across the lifespan that reflects the APTA's patient management model and the WHO's International Classification of Function (ICF). You'll study examination and interventions from the body structure/function impairments and functional activity limitations commonly encountered in patients with neurologic disorders. Then, understanding the disablement process, you'll be able to organize the clinical data that leads to therapeutic interventions for specific underlying impairments and functional activity limitations that can then be applied as appropriate anytime they are detected, regardless of the medical diagnosis.
